7. Presentation
Five Pediatric dose vial - 2.5 mL
2.5 mL suspension in 3ml capacity glass vial (USP type 1 glass) with stoppers
(Grey Bromobutyl rubber) and Light Pink coloured flip off Aluminium seal.

Handling of multi dose vial: Once opened, multi dose vials of JEEV* Vaccine
from which one or more doses of vaccine have been removed during
an immunization session may be used in subsequent immunization sessions for up to
a maximum of 4 weeks, provided that all of the following conditions are met:
- the expiry date has not passed
- the vaccines are stored under appropriate cold chain conditions
- the vaccine vial septum has not been submerged in water
- Aseptic technique has been used to withdraw all doses
- The vaccine vial monitor (VVM) has not reached the discard point.

Presentation available with or without vaccine vial monitor.

The vaccine vial monitor ........(Optional)

- Inner Square lighter than outer circle.
  if the expiry date has not been passed,
  USE the vaccine
- At a later time, inner square still
  lighter than outer circle.
  If the expiry date has not been passed,
  USE the vaccine
- Inner square matches color of outer circle.
  DO NOT use the vaccine
- Beyond the discard point:
  Inner square darker than outer ring.
  DO NOT use the vaccine.

Vaccine Vial Monitor (VVM) is part of the label. The colour dot appears on the label
of the vial, is a VVM. This is a time - temperature sensitive dot that provides an
indication of the cumulative heat to which the vial has been exposed. It warns the
end user when exposure to heat is likely to have degraded the vaccine beyond an
acceptable level.

The interpretation of the VVM is simple. Focus on the central square. Its colour will
change progressively. As long as the colour of this square is lighter than the colour
of the ring, then the vaccine can be used. As soon as the colour of the central square
is the same colour as the ring or of a darker colour than the ring, then the vial should
be discarded.

JAPANESE ENCEPHALITIS INACTIVATED VACCINE (Human)
(PURIFIED INACTIVATED VACCINE - ADSORBED)

1. NAME OF THE MEDICINAL PRODUCT
JE vaccine is a suspension for injection
Japanese encephalitis purified inactivated vaccine (adsorbed)

2. COMPOSITION
Each Pediatric dose of 0.5 ml contains:
 Purified Inactivated Japanese
 Encephalitis Virus Strain
 (SA-14:2)
 Alum 3 µg
 Aluminum as Aluminum
 Hydroxide 0.1% w/v
 Thiomersal BP 0.005% w/v
 Phosphate Buffer Saline q.s.
 - produced in Vero cells

The vaccine is formalin inactivated
For full list of excipients, see section 6.1

3. PHARMACEUTICAL FORM
Suspension for injection
The appearance of the liquid is a white, clear non-uniform suspension which
becomes homogenous upon shaking.

4. CLINICAL PARTICULARS
4.1 Therapeutic indications
JE vaccine is indicated for active immunization against Japanese encephalitis in
children (between ≥ 1 to < 3 years of age).
It should be used in children at risk of exposure through travel into areas where JE
is endemic, spending a month or longer in endemic areas during the transmission
season, especially if travel will include rural areas, or in the course of their occupa-
tion or residing in areas where JE is endemic or epidemic

4.2 Posology and method of administration
Method of administration
The vaccine should be administered by intramuscular route. The preferred site is
anterolateral aspect of the thigh for children. Do not administer intravenously,
intradermally, or subcutaneously.

Posology
The immunization schedules for JE vaccine should be based on official
recommendations.
The primary vaccination schedule consists of two separate doses of 0.5 mL each
according to following schedule:
First dose : day 0
Second dose: 28 days after first dose
It is recommended that vaccinees who received first dose of JE vaccine should
receive their 2nd dose of vaccination course with JE vaccine only.

The vaccine has to be administered by a qualified healthcare professional.
Immunization series should be completed at least 1 week prior to potential exposure
to JE. Before administration, shake the vial well to obtain a white, homogeneous
suspension. Do not administer if particulate matter remains following shaking or if
discoloration is observed.

4.3 Contraindications
Hypersensitivity to the active substance or to any of the excipients or to any residuals
(e.g. protamine sulphate).

Individuals who show hypersensitivity reactions after receiving first dose of the
vaccine should not be given the second dose.
Vaccine must not be given to individuals with known or suspected hypersensitivity to
any constituent of the vaccine.
Administration must be postponed in persons with acute severe febrile conditions.
4.4 Special warnings and precautions for use
As with all injectable vaccines, appropriate medical treatment and supervision should always be available to treat rare cases of anaphylactic reactions following the administration of the vaccine.

JE vaccine is an intramuscular vaccine and under no circumstance be administered intravenously.

As with any other vaccine, vaccination with JE vaccine may not result in protection in all cases.

JE vaccine will not protect against encephalitis caused by other micro-organisms. Like other intramuscular injections, this vaccine should not be administered to persons with thrombocytopenia, haemophilia or other bleeding disorders.

4.5 Interaction with other medicinal products and other forms of interaction
Interaction studies with other medicinal products have not been performed on JE vaccine. When JE vaccine is administered concomitantly with injectable vaccines, they should be given with separate syringes at different injection sites. JE vaccine should not be mixed with any other vaccine in the same vial.

4.6 Pregnancy and lactation

Pregnancy
Safety and effectiveness have not been established in pregnant women and in nursing mothers. In animal studies findings of unclear relevance have been identified for a similar product. As a precautionary measure, the use of JE vaccine during pregnancy or lactation should be avoided.

Lactation
It is not known whether this vaccine is excreted in human milk.

4.7 Effects on ability to drive and use machines
No studies on the effects of JE vaccine on the ability to drive and use machines have been performed.

4.8 Undesirable effects
The safety of the JE vaccine was assessed in a controlled clinical trial in ≥1 to <3 year old healthy Indian children in comparison with a licensed JE vaccine. Approximately 21% of vaccinated subjects can be expected to experience adverse reactions based on the clinical data. They usually occur within the first three days after vaccination, are usually mild or occasionally moderate in intensity and disappear within a few days. No increase in the number of adverse reactions was noted between first and second doses.

Most commonly reported local adverse reactions were injection site pain (8.5%) and tenderness (4.0%) and the most commonly reported systemic adverse reaction was pyrexia (11.1%). The other vaccine related adverse events reported were injection site swelling (3.29%), injection site erythema (2.63%), decreased appetite (1.32%) somnolence (1.64%) and rash (1.32%).

4.9 Overdose
No case of overdose has been reported.

5. PHARMACOLOGICAL PROPERTIES
5.1 Pharmacodynamic properties
Pharmacotherapeutic group: Encephalitis Vaccines, ATC Code: J07BA02
Japanese encephalitis is a disease caused by the mosquito-borne Japanese encephalitis virus (JEV). JE vaccine is a vero-cell based purified inactivated vaccine that is known to act by inducing antibodies that neutralize live JEV.

Mechanism of action
The mechanism of action of Japanese encephalitis (JE) vaccines is not well understood. Studies in animals have shown that the vaccine triggers the immune system to produce antibodies against Japanese encephalitis virus that are most often protective.

In other challenge studies in mice by a similar inactivated JE vaccine showed that almost all mice that had a Plaque Reduction Neutralization Test titre of at least ≥1:10 were protected from a lethal Japanese encephalitis virus challenge.

The World Health Organization consultation group recognizes a PRNT titre of ≥1:10 as being a reasonable correlate for protection.

Clinical studies
In a phase-I study, the safety of this vaccine was established in healthy adult volunteers and the development proceeded to phase II/III study. The phase-II part of the phase-II/III study established single dose safety in healthy ≥1 to <3 year old Indian subjects which was closely monitored by an independent Data Safety Monitoring Board.

The immunogenicity of the vaccine was further evaluated in healthy ≥1 to <3 year old Indian subjects of either gender in a multicentre, open label, parallel, randomized phase-II/III study. The objective was to evaluate both immunogenicity & safety of this vaccine administered intramuscularly to ≥1 to <3 year old healthy Indian children in 2-dose (0, 28 Day) schedule in comparison with a licensed mouse brain derived inactivated JE vaccine administered subcutaneously in 3-dose (0, 7 & 28 Day) schedule.

The primary end point was to assess whether proportion of subjects seroconverted (PRNT50 ≥1:10) in both the groups at Day 56 were similar and JE vaccine is non-inferior to the licensed Comparator JE vaccine. The study results revealed that the GMT levels increased from 9.7 at baseline to 217.9 by Day 56 with JE vaccine and the vaccine demonstrated to be non-inferior to the licensed Comparator JE vaccine.

5.2 Pharmacokinetic properties
Evaluation of pharmacokinetic properties is not required for vaccines.

5.3 Preclinical safety data
Non-clinical toxicity data is limited

A 28-day repeat dose toxicity study of Japanese encephalitis vaccine (JE) vaccine administered intramuscularly to Wistar rats in 3 occasions (1, 14 and 28 day) was found to be safe and immunogenic in animal studies. Non-clinical data reveal no special hazard for humans based on repeated dose toxicity in mice.

In a similar reproductive and pre-/post-natal toxicity study with another JE vaccine, no vaccine-related effects were detected on reproduction, foetal weight, survival and development of the foetal. However, incomplete ossification of parts of the skeleton was observed in the group receiving 2 doses, but not in the group receiving 3 doses. It is currently difficult to explain if this phenomenon is treatment related or not.

6. PHARMACEUTICAL PARTICULARS
6.1 List of excipients
- Phosphate buffer saline consisting of:
  - Sodium Chloride
  - Potassium dihydrogen phosphate
  - Disodium hydrogen phosphate
  - Water for injection
  - Thiomersal

6.2 Incompatibilities
This medicinal product must not be mixed with other medicinal products.

6.3 Shelf life
<2 years

6.4 Special precautions for storage
Store in a refrigerator at 2° - 8° C (35° - 46° F).

Do not freeze. Discard if the vaccine has been frozen.

Do not use the vaccine after the expiration date shown on the label.
Store in the original package in order to protect from light. During storage, a clear liquid with a white sediment can be observed.
